Novel polypeptides expressed in tumor cells useful for treating cancers have an ability to complex with a major histocompatibility complex molecule and comprises a specific unbroken amino acid sequence.

Claim 1; Fig 7; 80pp; English.

decappetide sequences, that function as tumour rejection antigens (TRAs). These peptides are capable of forming a complex with major. These peptides are capable of forming a complex with major histocompatibility complex (MRC) molecule type HLA-A2.1 (Human Leucocyte Antigon), that are recognised by T.lymphocytes and elicit an immune response from cytolytic T-lymphocytes (CTL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or preventing tumour growth. The present sequence is the human MAGE-AlO protein, comprising nonapeptides and decapeptides, that serve as tumour patent discloses MAGE-A10 and MAGE-A8 polypeptide, nonapeptide and The

rejection antigens (TRAs). The novel TRAs encoded by MAGE-Al0 is identified using melanoma cell line (LB1751-MEL), stimulated by autologous CTL clone (447A/5) to produce TNF (tumour necrosis factor). Expression of MAGE-Al0 has been detected in a variety of tumours like melanomas, carcinomas of the head and neck, bladder and prostate, myelomas and lung cancer. The only normal tissue expressing MAGE-Al0 is

The present invention relates to human secreted prostate cancer antigen coding sequences (AAP72741-AAP72789) and proteins (AAB802731-AAB802731).

The coding sequences and proteins of the present invention are useful for preventing, treating or ameliorating a medical condition; and for the diagnosis and treatment of diseases and disorders. Diseases and disorders can be diagnosed and treated include (auto)immune diseases and disorders can disorders (e.g. asthma), hyperproliferative disorders (e.g. arfat versus host disorders (e.g. asthma), hyperproliferative disorders (e.g. cancers and leukemias), carebrovascular disorders (e.g. stocke), arterial occlusive disorders (e.g. arteriosclerosis), angiogenesis related disorders (e.g. crinopathy and keloid scars), ocular disorders (e.g. glaucoma), neurological disorders (e.g. Alzheimer's, Parkinson's disease, epilepsy and Creutzfeld-Jakob disease) and infections caused by bacteria, fungi, viruses or parasites They may also be useful for wound healing, epithelial cell proliferation, supporting cell culture, tissue regeneration, birth control and as a food additive or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a blological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059 cencode the human bladder cancer-associated proteins given in ABR48146 to ABR48242). Bladder cancer-associated proteins given in ABR48146 to have cytostatic activities, and can be used in artisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosting or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ಡ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SSCYPLIPSTPEEVSADDETPNPPQSAQIACSSPSVVASLPLDQSDEGSSSQKEESPSTL 120

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer. associated polymucleotides and polympetides are used for identifying a compound that modulates a lung cancer-associated polympetide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, lung cancer or other benign or precancerous lesions, e.g. atelectasis, chypersensitivity pneumonitis, interstitial pulmonary fibrosis, atthma and bronchiectasis. The genes, polymotaeotides and polympetides are useful cor diagnostic purposes and as targets for screening for therapeutic

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and esquences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids equences ("Ily defined in the specification. The probe is a single exon probe that daressable set of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid and addressably solatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a vector comprising the single exon and addressably single-exon probe of the plurality of probes is geparately and addressably single-exon probes or microarray for measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above- mentioned amino acid so contiguous amino acids of any of the above- mentioned amino acid so contiguous amino acids of any of the above- mentioned amino acid solated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, and a computer-readable content record including data on the expression, and a computer-readable content and above. The probe methods and apparatus are useful in gene cypression analysis. The probes may be used as tools for surveying the above. The probes are used in identifying and characterising grounder contain their genemic alterations in the probes are used in identifying and characterising grounder contain their sequence and alterative splicing events, in detecting and characterising grounder and aller genomic alterations in the speciment of the probes of the private of the presence of expression when the pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to cDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antiense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, cyoteatic and tranquiliser activities. This polypeptide is a protein encoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

The present sequence represents a human MAGE-A11 polypeptide. The specification also describes MAGE-A5, MAGE-A8, MAGE-A9, and MAGE-A11 polypeptides. The MAGE genes encode tumour rejection antigens which complex to human leukocyte antigens (HLAB), and provoke response by autologous, cytolytic T cells. The genes are located in region q28 of the X chromosome. The MAGE polynucleotides are useful for diagnosis of cancer
                                                                                                    240

The specification also describes MAGE-A5, MAGE-A8, MAGE-A9, and MAGE-A11 polypeptides. The MAGE genes encode tumour rejection antigens which complex to human leukocyte antigens (HLA8), and provoke response by autologous, cytolytic T cells. The genes are located in region q28 of the X chromosome. The MAGE polynucleotides are useful for diagnosis of cancer

The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour-associated antigenic target (TAT) polypeptide PRO83395, SEQ:6309

mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and comparising a polypeptides; expression vectors and host cells compirating a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide of the invention

is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed sequence tags (ESTS) known to be expressed in the phenotype/cell type of interest with all ESTS expressed in the phenotype/cell type of interest with all ESTS expressed in the in order to identify ESTS that are preferentially expressed in the condition of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably as a tumour cell, and the predetermined phenotype is a stress-induced phenotype such as hyperosmotic stress or high salt conditions. A method of the invention is also useful for determining the progression of colon cancer in a human, for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell. An antibody of the invention is useful for detecting at the antibody of the invention is useful as an endingent for vaccinating an animal. The present sequence represents a cumour-associated markers. A polypeptide of the invention is useful as an endingent of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 156
                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121 QVLPDSESLPRSEIDEKVTDLVQFLLFKYQMKEPITKAEILESVIKNYEDHFPLLFSEAS 180

                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel anticancer agent that comprises the melanoma antigen MAGE-A4 related protein. Specifically, it refers to a MAGE-A4 containing Cytostatic agent useful for treating hepatic cancers that highly express gankyrin, where gankyrin is a Gann ankyrin repeat protein also known as PSWD10 or the P28 oncogene. The present invention describes using MAGE-A4 as a preventative or therapeutic agent to suppress gankyrin activity and hence tumourigenesis. This polypeptide sequence is the human MAGE-A4 related protein of the invention.
                                                                                                                                                                                                                                                                                                                    Novel cytostatic agent for cancers expressing gankyrin, comprising melanoma antigen (MAGE)-A4 related protein and having binding property with gankyrin, useful as preventive or therapeutic agent of cancer.

```
The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80% identical to a gene that exhibits increased or decreased expression in lung cancer associated polymucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ω,
                                                                                                                                                                                                                                                                                                                                                                                                                                 for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences there is a such as antibodies. Sequences the such as antibodies are set of the such as antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 44

The present invention relates to MAGE-A4 human leukocyte antigen (HLA) class I-binding peptides, and their use. The antigenic peptides derived from MAGE-A4, when presented by HLA-B37, induce the activation and proliferation of CD8+ cytotocaic T lymphocytes. Also disclosed are the polypeptide and polynucleotide sequences for human MAGE-A4. The peptides of the invention are useful for treating a subject having a disorder with aberrant expression of MAGE-A4. Such disorders particularly include cancer, e.g. metanoma, myeloma or leukaemias. The present sequence

The present sequence represents a human MAGE-A9 polypeptide. The specification also describes MAGE-A5, MAGE-A8, MAGE-A9, and MAGE-A11 polypeptides. The MAGE genes encode tumour rejection antispens which complex to human leukocyte antigens (HLA8), and provoke response by autologous, cytolytic T cells. The genes are located in region q28 of the X chromosome. The MAGE polynucleotides are useful for diagnosis of cancer
                                                                                                                                                                                                                                                                                                                                                    300

Claim 27; Page 401; 453pp; English

```
The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymoleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in creased or decreased expression in lung cancer samples. Lung cancer-associated polymoleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer in a patient and for treating a mammal having lung cancer to compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lessions, e.g. atclectasis, hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polymucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences the compounds that modulate lung cancer, such as antibodies. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ų,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 3
138661
melanoma antigen MAGE-4 - human
melanoma antigen MAGE-X2
N/Alternate names: MAGE 41 protein; melanoma antigen MAGE-X2
C;Species: Homo sapiens (man)
C;Species: Homo sapien

TISSUB SPECIFICITY: Expressed in many tumors of several types, such as melanoma, head and neck squamous cell carcinoma, lung carcinoma and breast carcinoma, but not in normal tissues except for testes and placenta.
SIMILARITY: Contains 1 MAGE domain.
                                                                                                                                                                                                                                                                de Plaen E., Arden K., Traversari C., Gaforio J.J., Szikora J.-P., de Smet C., Brasseur F., van der Bruggen P., Lethe B., Lurquin C., Brasseur R., Chomez P., de Backer O., Cavenee W., Boon T.; "Structure, chromosomal localization, and expression of 12 genes of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: Not known, though may play a role in embryonal development and tumor transformation or aspects of tumor progression. Antigan recognized on a melanoma by autologous cytolytic T lymphocytes subcellular LOCATION: Cytoplasmic.

TISSUE SPECIFICITY: Expressed in many tumors of several types, such as melanoma, head and neck squamous cell carcinoma, lung carcinoma and breast carcinoma, but not in normal tissues except for testes. Never expressed in kidney tumors, leukemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TISSUE=Blood;

Sequence 8188, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
PILE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
CURRENT APPLICATION NUMBER: US/09/949,016

PRIOR APPLICATION NUMBER: 60/241,755
PRIOR PILING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-10-03

NUMBER: OF SEQ ID NOS: 207012
